

# LLMs: From Confusion to Illusion

A Journey Through NLP

Jatin Gupta

# Before the LLM Era – Dark Ages of NLP 🦖

A simpler time when algorithms followed rules and didn't throw tantrums.

- Regex: aka, “if this, then probably that”
- Bag of Words: the OG word salad
- TF-IDF: Weighing words like we weigh guilt
- RNNs & LSTMs: Basically memory-challenged toddlers

Google Assistant

# Understanding NLP: A Beginner's Guide

## NLP Basics – AKA Painful Terminology

NLP stands for Natural Language Processing, which is the field that **bridges human language and computers**. It enables machines to understand, interpret, and respond to text or speech like us!

# Tokenizaion

Slicing sentences into digital gibberish

Tokens

# Embeddings

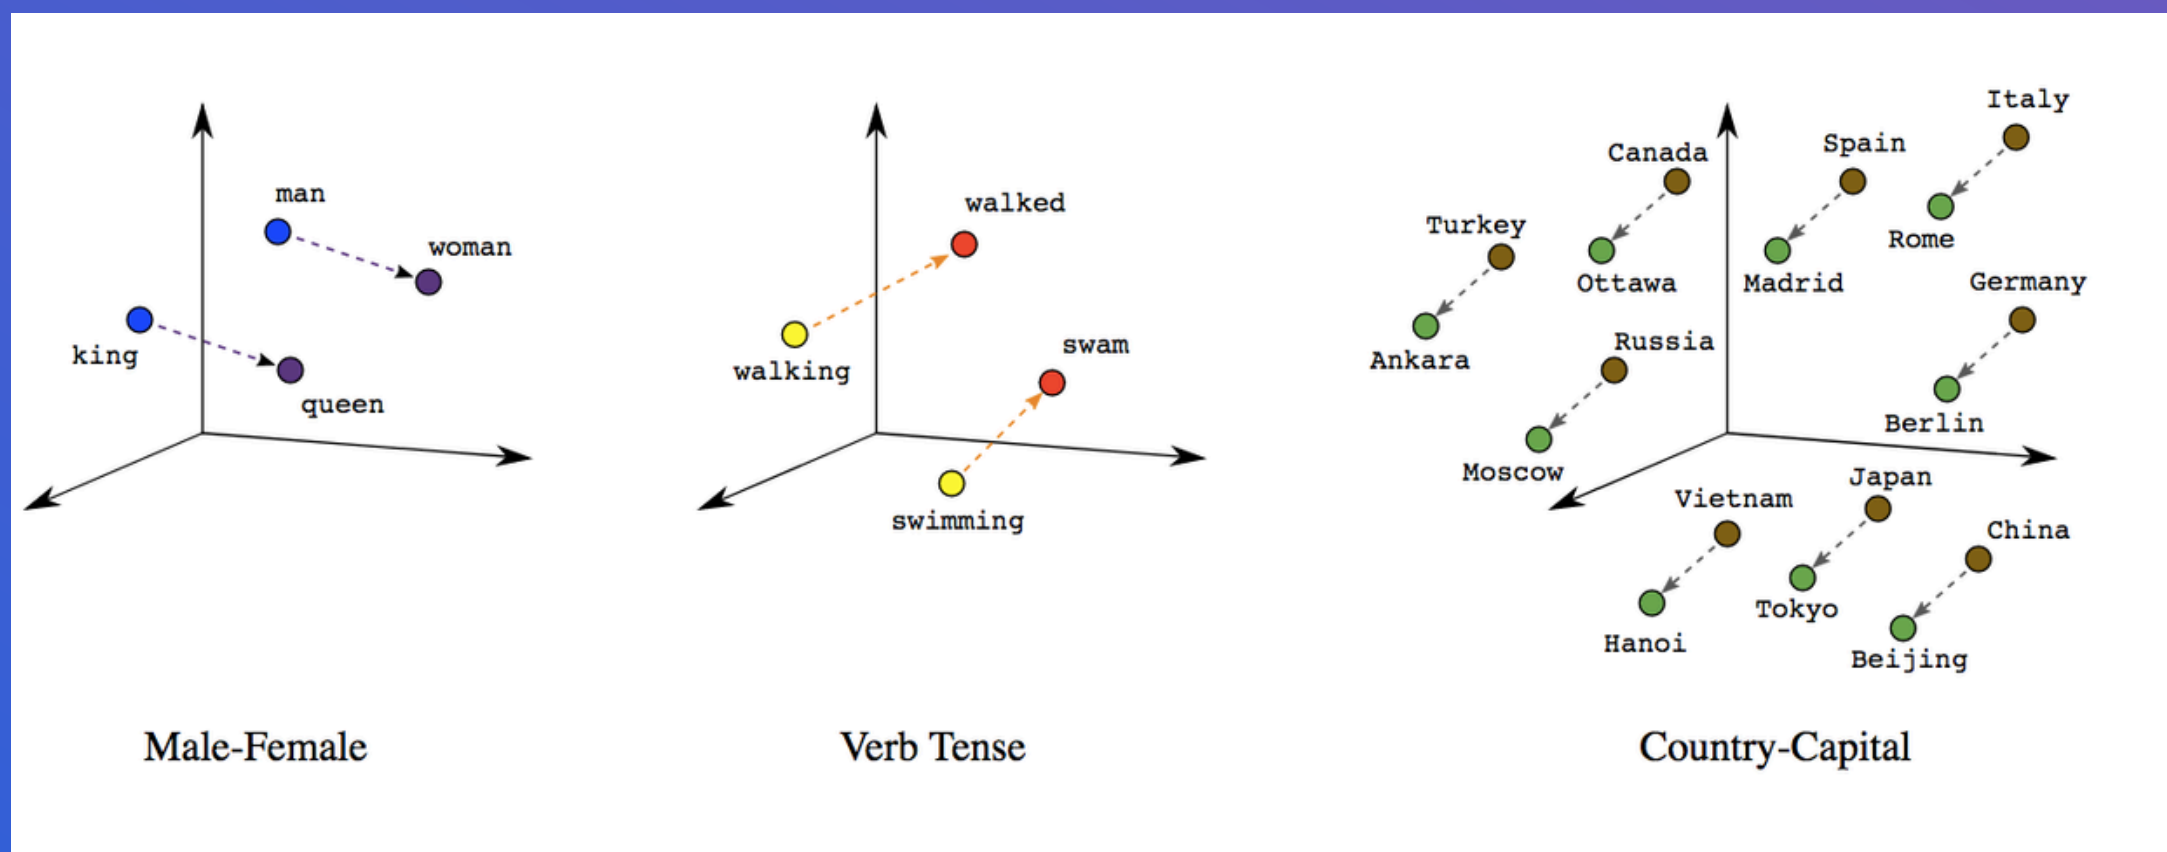

Map each token to a dense vector.

## Embedding

We	love	NLP
		
[0.18 0.64 0.32] 0,15	[0.56 0.11, 0.89, 0,45]	[0.56, 0.11, 0.89,] 0,45]

# Storing These embeddings

These are the high-dimensional word embeddings inside LLMs — compressed to 3D just so our tiny human brains can pretend to understand how language relationships work.

# 2017 – Google Drops the Mic

Attention is all you Need!

- 
- Vaswani et al., aka the squad that broke NLP  
They **Introduced** Transformers

# Key Moments in LLM History

ELIZA (1966)

Transformer Models (2017)

GPT-2 (2019)

GPT-3 (2020)

LaMDA & PaLM (2021–2022)

ChatGPT (2022)  
– GPT3.5

Multimodal & Open-Source Boom (2023–2025)

# Modern LLMs: What to Expect and Look For

Here are the key features of modern LLMs:

- Large datasets, because size matters in AI.
- Human-like responses that might just fool you.
- Fine-tuning capabilities to make them **even smarter**.
- Ethical considerations, or at least we hope so!
